

Required Update – OneRoster

[Instruction > Settings > Digital Learning Applications](#)

Starting January 1, 2027 Infinite Campus will no longer support OneRoster v1.1 Oauth v1 or LTI v1.1 Connections.

Vendors should be aware of this change, as Oauth v1 and LTI v1.1 ended support from 1EdTech in July of 2025 and should have new options set up. If they do not, you need to let them know that it will be required going forward.

What is OneRoster?

OneRoster is an API connection tool that allows vendors to pull information from Infinite Campus, and in the case of some supported vendors, place information into Infinite Campus. (Note: this is not SFTP SQL extraction)

What You Will Need To Do:

Any Districts with Vendors still using a OneRoster connection utilizing a Oauth v1 or LTI v1.1 connection will need to update those OneRoster API connections before that date.

Required Update - OneRoster

[Instruction](#) > [Settings](#) > [Digital Learning Applications](#)

How to check if your Vendors are affected:

- **Go to Instruction > Settings > Digital Learning Applications**
 - *Note: This tool requires Campus Learning, if you do not have that premium piece, then you do not have any OneRoster Connections.*
- **Check to make sure that v1.1 connections are running Oauth version 2**
- **Click Edit to Check to See version of LTI (needs to be 1.2 or 1.3)**
 - **Most OneRoster connections do not use an LTI Connection.**

This toggle shows whether the connection is enabled.

If running 1.1, make sure that the Oauth Version is 2.

Click Edit to see if Connection uses LTI and what version it is using.

How to create a new OneRoster Connection:

- After following the steps to get to the vendor information from the previous slide, Click the “Generate New OneRoster Connection” button.
- Select OneRoster v1.1 oauth v2 or OneRoster v1.2
- Click Generate
- Copy and enter the information generated for the connection into your vendor's software setup area. If you need help with this step, you will need contact your vendor's support team.
- Once you are sure that the new connection is working, go in and disable the old v1.1 Oauth v1 OneRoster connection by toggling the enable slider.

How to create a new LTI 1.3 Connection:

- After following the steps to get to the vendor information from the previous slide, click the 'Edit' button next to the vendor to open its connection information.
- Click the "Generate New LTI 1.3 Connection Button (If this button is not present, then this connection does not support LTI)
- Copy and enter the information generated for the connection into your vendor's software setup area. If you need help with this step, you will need contact your vendor's support team.
- Once you are sure that the new connection is working, go in and disable the old LTI connection by toggling the enable slider.

Data Extract Utility

[System Settings](#) > [Data Utilities](#) > [Data Extract Utilities](#)

User Owned AdHoc Extracts

It has come to our attention that when a district user account is disabled or removed, if they had created an AdHoc that is currently in use in the Data Extract Utility for a vendor extract, it will stop working. This is true no matter where that AdHoc is currently owned or placed within the system (group, folder, etc.)

Campus is aware of the issue, but until a fix is in place, if you have a sis admin level user (EMIS, Tech, etc.) leave the district, please let us know so we can check to make sure no AdHocs tied to your vendor extracts are currently in use that were created by that user.

Blank Data Extract Utility Page

Campus has made us aware of a browser-based issue with Chrome and Edge where the Data Extract Utility tool can appear to not have any extracts in it upon loading. This is due to an issue with how the data is being loaded by those browsers and is not something they can fix on their end. However, you can easily make the data appear by toggling between the Inactive and Active settings in the filter above the Data Extract area.
